Calibration of computer models Introduction

Pierre BARBILLON

Fall 2023

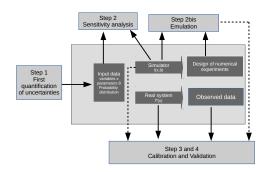

1/8

Uncertainty Quantification / Model Uncertainty

In this course, we will focus on calibration and validation.

P. Barbillon Introduction Fall 2023 2/8

Calibration of a computer code

Computer experiments:

Computer model (simulator) $(\mathbf{x}, \theta) \mapsto f(\mathbf{x}, \theta) \in \mathbb{R}^s$ where

- physical parameters: $\mathbf{x} \in \mathbb{X} \subset \mathbb{R}^p$ observable and often controllable inputs
- simulator parameters: $\theta \in \Theta \subset \mathbb{R}^d$ non-observable parameters, required to run the simulator.

2 types:

- "calibration parameters": physical meaning but unknown, necessary to make the code mimic the reality,
- "tuning parameters": no physical interpretation.

Goal:

Calibrate the code: finding "best" or "true" θ from real observations / field data (provided by physical experiments):

$$\mathbf{y}^e = \{y_1^e = \zeta(\mathbf{x}_1^e), \dots, y_n^e = \zeta(\mathbf{x}_n^e)\},$$

where ζ is the real physical phenomenon.

P. Barbillon Introduction Fall 2023 3/8

Validation

- Validation (rather than verification) is considered,
- Does the computer simulator correspond to field data?

$$\exists \boldsymbol{\theta}^*$$
?, s.t., $\forall \mathbf{x}$, $f(\mathbf{x}, \boldsymbol{\theta}^*) \approx y(\mathbf{x})$

- This question is related with intended use of the simulator: range of x, required precision...
- Biased computer model, no setting of calibrated parameters leads to outputs close to field data
 - \Rightarrow discrepancy.
- Do we want to validate the computer model itself or the computer model with the bias / discrepancy correction?

Framework

KOH framework chosen for this course:

[Kennedy and O'Hagan, 2001, Higdon et al., 2004, Bayarri et al., 2007].

History Matching not consider but may be relevant depending on the objective [Craig et al., 1997, Vernon et al., 2010, Boukouvalas et al., 2014, Andrianakis et al., 2017]

P. Barbillon Introduction Fall 2023 5/8

Deterministic or stochastic simulator

In most contributions, *f* is considered as deterministic.

But some recent work considered f as stochastic ([Baker et al., 2022]):

- f uses stochastic approximations (MC,...) but the modeled phenomenon is deterministic ζ ...
- f models a stochastic phenomenon $\zeta(\cdot)$ is stochastic.

P. Barbillon Introduction Fall 2023 6/8

Notations

- $\zeta(\mathbf{x})$ real physical or biological phenomenon,
- $f(\mathbf{x}, \theta)$ numerical code/model with \mathbf{x} bservable or controllable input variable, θ model parameter (no counterpart in the real phenomenon.
- DoNE: Design of Numerical Experiments: $D^c = \{(\mathbf{x}_1, \theta_1), \dots, (\mathbf{x}_N, \theta_N)\}$ with corresponding evaluations of the computer model (time-consuming):

$$\mathbf{y}^c = f(D^c) = \{f(\mathbf{x}_1, \boldsymbol{\theta}_1), \dots, f(\mathbf{x}_N, \boldsymbol{\theta}_N)\}.$$

• DoFE: Design of Field Experiments: $D^e = \{\mathbf{x}_1^e, \dots, \mathbf{x}_{n_e}^e\}$ with corresponding noisy observation of ζ :

$$\mathbf{y}^e = \{y_1 = \zeta(\mathbf{x}_1^e) + \epsilon_1, \dots, y_n = \zeta(\mathbf{x}_{n_e}^e) + \epsilon_{n_e}\}.$$

P. Barbillon Introduction Fall 2023 7/8

Outline

- Calibration KOH and extensions
- Sequential design of experiments
- Focus on the discrepancy function and validation
- Extensions to calibration of stochastic simulator
